If you dont have the Creative Cloud desktop app and are not signed in to it, you will receive an expiration notice, a sign in prompt, or a message about a serial number when you open up any Adobe app do not sign in to the app as it wont properly license. This means you likely have the old UMBC Adobe license installed didnt require you to be signed into your UMBC Adobe account to use, which will cease to function without the Creative Cloud desktop app. To avoid that, please install and sign in to the Creative Cloud desktop app using the instructions for UMBC owned computers here. If you have issues installing the Creative Cloud desktop app, please refer to the troubleshooting guide below or submit an RT ticket to receive assistance. The methods listed below are in no particular order, they are numbered just for easy reference. Section 1 Issues installing the Creative Cloud desktop app for UMBC owned computers only Sometimes, existing Adobe app installs may cause the

Creative Cloud desktop app to fail to install. If you believe this to be the case, uninstall all Adobe applications from the computer and then restart the computer. Next, use the Adobe CC Cleaner Tool to remove any traces of the Adobe apps that may remain, restart the computer, and then try installing the Creative Cloud desktop app again. If the extracted installer is located in a folder with a long file name, is nested within too many folders, or is running from a network drive, there is a much higher chance the installation will fail. To avoid this, you can run the installer from your desktop or from a directory with a short name. If you get an installation failure, make sure you dont have any other applications or updates running in the background while installing the Creative Cloud desktop app. Another option is to restart the computer before installing the Creative Cloud desktop app.

Installation Failure Guide dont download the Creative Cloud desktop app from any of the links in the guide, only download it from the links on the righthand side of this page . Run the installer as admin in Windows If you have admin privileges on your computer, you can run the installer as admin by rightclicking InstallCC batch file and selecting Run as administrator from the menu that appears. Manual installation in Windows Instead of opening the InstallCC batch file shown in step 4 of the installation instructions , open the Build folder and run the setup file to begin the installation. Optionally, just like the InstallCC batch file, i f you have admin privileges on the computer, you can run the setup file as admin by rightclicking it and selecting Run as administrator from the menu that appears. Section 2 Issues using the Creative Cloud desktop app for personal computers and UMBC owned computers Dont sign in to the Creative Cloud desktop app through Continue with Google, Continue with Facebook, or Continue with Apple as doing so will only give you access to trial versions of Adobe apps. As per the install instructions, sign in to the Creative Cloud desktop app by typing in your UMBC email address, click Continue, click Company or School Account and when it takes you to myUMBC, type in your myUMBC credentials and then click Log In. Make sure to use your default UMBC email address when signing in to the Creative Cloud desktop app since email aliases will likely fail the sign in process or only give you access to trial versions of Adobe apps. It is highly recommended to check the system requirements of the Adobe apps you want before trying to install them. If your computer does not meet an apps system requirements, the Creative Cloud desktop app will display the app as not being compatible and it will prevent you from installing it. You dont have access to manage apps This error message is an Adobe installation bug and not an account access or permissions issue.

First, try deleting the contents of the OOBE folder and relaunch the Creative Cloud desktop app as shown in method 3 here. If that doesnt work, follow the other steps Adobe explains here. First, uninstall the old Adobe apps. Next, use the Adobe CC Cleaner Tool to remove any traces of the old Adobe apps that may remain before trying to install the apps again. Apps showing up as trial versions It is a known Adobe issue that all Adobe customers can encounter uninstalling and reinstalling usually wont fix the issue. To fix this, sign out of the Creative Cloud desktop app click the blue circle at the top righthand corner and click Sign out and then sign in again. If Sign out is grayed out and preventing you from signing out, an Adobe update is likely running click the cloud icon next to the blue circle to see the updates progress and you may have to wait several minutes for it to finish before it allows you to sign out. Here is Adobes official documentation about this issue. If all the aforementioned does not resolve the issue, additional ways to resolve licensing issues are further detailed by Adobe here. Limited access error in Creative Cloud desktop app Creative Cloud Libraries panel doesnt load in desktop products Error messages Common error codes for Creative Cloud apps or lookup error codes from here . The Creative Cloud desktop app is required to access Adobe apps Adobe requires it for apps to license and function properly. If for some reason you need to uninstall it and are unable to, use the Creative Cloud desktop app uninstaller. To successfully implement color management into your workflow, you'll have to give special attention to the software, hardware, and configuration of those tools at nearly every step of your postproduction pipeline. One group is sensitive to long wavelengths reds, another is sensitive to medium wavelengths greens, and the last is sensitive to short wavelengths blues. When these cells are stimulated by their corresponding wavelength ranges, they send a signal to our brain, which then interprets the signal in a particular way, what we call color. Thankfully, our brains can mix the signals from our cones together so we can "see" secondary hues like yellow, magenta, cyan, and all the other colors we know and love. They took this data and plotted it onto a graph, now known as the CIE 1931 Chromaticity Diagram. Think of it as a map, where every humanlyperceivable color can be found. And for that, we used a color model. Why red, green, and blue. Because our biological vision system is based on those wavelength ranges. Since we're here to talk about digital video, we're only going to talk about RGB. Since humans and machines like computers can agree on mathematical values, that lets us tell computers what colors are or at least how to calculate them despite the fact that they don't have eyeballs. With just these values, we can ask a computer for a particular color for example, Frame.io purple and it will give us exactly what we want 33.33% red, 35.69% green, and 96.47% blue. To complete the calculation, the computer needs to know what red, green, and blue points on the map it is supposed to calculate from. 33.33% of which red, and 35.69% of which green Different primary color points will result in different outputs. So to standardize the results, we need to tell the computer which points to use, and we do that by using a color space. By defining the locations for the three primary colors, this tells a computer where on the map 100% of red, green, and blue are found.

Once it knows where home is for the three primary color points, it can find every other color relative to them. It is a color space, after all. It's just not possible with our current technology and may never be. So, in order to make it easier to use color digitally, we need primary color points that computers can actually handle. There are also some color spaces for specific technical applications, like DCIP3 for cinema projection. However, a simple way to compare them is by their gamuts. Generally speaking, a color space with a larger footprint is said to have a wider gamut. The bigger the area, the greater range of visible colors it can locate. It is not the number i.e. how many greens of colors that an image file can contain. To make that measurement, we need to understand color depth. More bits of information allows for more possible colors to be described. Color is both a physical property of light at different wavelengths and our vision system's perception of this property. In order to create eyeballlless machines that can represent colors accurately, we had to first build a system for calculating colors mathematically. Bigger gamuts cover a larger range of possible colors. When media comes from lots of different sources, and is passed between different processes, inaccuracies can be introduced into the color information every step of the way. Even footage from a single

camera that's edited on a single system can still experience these issues, as different creative applications interpret color differently as we'll cover below. Imagine how much more challenging this process is when you start moving media between machines and facilities. No matter the size of your workflow, color management can increase the quality and consistency of your work. You just have to know where to start. That will determine the main color space of your workflow, which in turn influences the hardware you can use and the configuration of your software.

But if you're creating content for digital cinema projection, then you will need to work in DCIP3, which will demand more specialized hardware.It does not mean it's the only color space you'll ever have to deal with. Every color space is the best choice for at least some situations, but no color space is the best choice for every situation. As images move through your workflow, you want a color space that is as easy to manage as possible, but also isn't restricted too much by a small gamut. They will need to be properly converted in order to be displayed correctly on your machines and for the final delivery format. Improper conversions can ruin the visual style of your footage, so always run tests before finalizing the color management of your workflow. Using wider gamut color spaces will require more time managing and tweaking your workflow to ensure that your color management standards are preserved. This yields excellent capabilities for image control, but takes considerable investment.Take a good hard look at your anticipated project requirements for the next multiyear period before deciding on your color space management. Leave it alone. They use what are called " ICC profiles " to ensure that colors are displayed correctly across different screens. These profiles are created by the device's manufacturer according to standards laid down by the International Color Consortium Ihence the acronym ICC. Any device that captures or displays color information can be profiled, and these profiles help enable color management across diverse hardware devices. ICC profiles, on the other hand, characterize how a device responds to and represents color information so that different devices can operate on the same basic rules for the same color space. These profiles are designed by the manufacturer for your specific display. In most cases, you will only have one option. In most cases you will only have one option, named after the model of your monitor.
